

COST MANAGEMENT AND BUDGETS IN AWS

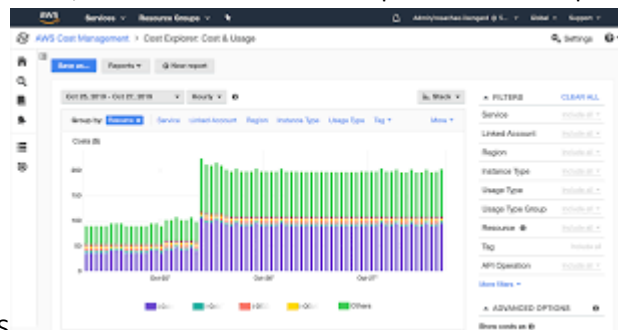

When you begin using services in your AWS account you are charged for the usage of each service based on the service utilization and consumption dimension, such as the number of hours and EC2 running or the number of gigabit that you stored. The AWS billing console provides a single location for you to view your AWS bills, and analyze your historic and monthly to date cost. Set budget and alert for monitoring. Manage savings plans and reserved instances.

Your bill is not finalized until the end of the month. Within the billing console is a tool called the AWS Cost Explorer.

COST EXPLORER

Cost Explorer has an easy to use interface that let you visualize, understand and manage your AWS cost and usage over time. Can be used to analyze and dive deep into your cost and quickly identify trend. It also helps to identify anomalous cost and usage events across your account, based on historical patterns. Helps you view

key cost details and saved reports

AWS Budget

Helps to track your cost, usage, or coverage and utilization for your reserved instances and savings plans, across multiple dimensions, such as servers, or cost categories. You can use AWS budget to set up event driven alert notification for when actual or forecasted cost or usage exceeds your budget limit, or when your RI and savings plans coverage drops below your threshold. AWS budget helps create annual, quarterly, monthly or even daily budget depending on your needs.
